ItemsAdder With CloudFlare Proxied Domain For IP Protection

- Create a proxy pass for the domain and add to CloudFlare.
- Cert it with LetsEncrypt and give the port to the server on the panel, like 20000.
- Update ItemsAdder with the details below and make all the other "host" types false.
- This texture pack option should fully deploy automatically, and the game should recognise it.
- If it doesn’t, open the MC log and see if it “Times out”, if it does, you’ve done a configuration wrong!

```
  self-host:
    enabled: true
    server-ip: https://texturepack.domain.com
    pack-port: 20000
    append-port: false
```
